promotion.py:1158
B
SCORING LAYER — pure arithmetic. The only data entering is the recorded metric value.
recursive_gain = E[best|cand] / E[best|par]
inverted if direction = min
promotion_score = mean(chal) / mean(champ)
no direction, no n recorded
divisor = 0
REFUSES the close
divisor = 0
freezes score = 0.0
verdict ∈ { accepted, rejected, inconclusive }
challenger 0.5 beats champion 0.0 — an undefined ratio — and the frozen score reads as total failure
C
EMITTED VALUES — the numbers that actually reach the operator
the only input to claim.confidence
belief.param_importance = 1 / n_vars (uniform) whenever n < 2
claim.confidence
= lookup[verdict string]
no data input at all
claim.importance
= 0.5 always
no data input at all
edge.weight = 1
strong and weak
evidence identical
× no n, no dispersion
× no n, no dispersion
× no n, no dispersion
every value above is a float in the same schema; the interface does not distinguish measured from asserted
D
OPERATOR-VISIBLE SURFACE
status digest · web dashboard · claim graph · MCP read surface
confidence 0.85 | recursive_gain 1.00 | promotion_score 0 | importance 0.5
E
RECORDED BUT NEVER CONSUMED — the inputs a score of this kind would need
seed count n
stored on the tournament, recorded nowhere near the frozen score
dispersion
variance IS recorded per observation, but reaches neither scorer
effect size
no SESOI, no minimum detectable effect, no power calculation
n = 1 allowed
close requires ≥ 1 result per arm — and never more than that
STRUCTURAL GATES THAT DO WORK — no numbers involved
evidence edge required to exceed 0.3 · contract frozen at open · one budget for both arms · conclusions insert-only
hardcoded / unsourced
scoring function
categorical input
recorded, never consumed
